

NET LINEDANCER OVERVIEW

LogicVein

Privately held and steadily profitable, LogicVein has been focused on the network management domain for over a decade as a respected provider of innovative solutions. We are pleased to introduce Net LineDancer. Configuring and managing network devices is still an often error-prone, manual process.

Net LineDancer

A sophisticated but simplistic and easy-to-use Network Configuration and Change Management (NCCM) software designed to help network engineers manage the configurations on the network devices (routers, switches, etc.) in their enterprises. Net LineDancer is an integrated, cloud-ready solution with the tools, reporting, automation, and integration capabilities you need in a low-cost, easy-to-use package.

Multitenancy

In addition to enabling support for overlapping IP spaces, our SmartBridges allow network operations to occur geographically closer to the devices under management.

SmartChange

SmartChange templates for running unique commands against devices all at once, created with a point and click interface, supporting per-device value parameterization, and Excel spreadsheet import.

Terminal Proxy Auto-Login

Provides an integrated Terminal Proxy that allows users already authenticated into Net LineDancer to SSH/Telnet into network devices.

SmartBridge

A great solution for managing your network from a single location even if your network has multiple subnets with overlapping IP spaces

Inventory Management

Full hardware inventory far audit including daughter card serial numbers, as well as power-supplies, and even fan tray assemblies.

Cisco PnP Support

Cisco PnP devices, in combination with a Cisco PnP-compliant server, can provide "hands free" configuration of new equipment in your network.

Net LineDancer

Bulk Change

Push out tens or thousands of changes safely to your devices safely and quickly

Multi-Vendor Support

42 vendors (104 Operating Systems).

Scalable Solution

200,000+ nodes easily

Cloud ready

Several LVI customers offer NetLD as a service (SaaS) to their customers via public and private clouds.

Buy enough licenses for all the devices. And enough Smart Bridges for each customer.

TOOLS AND FEATURES INCLUDE:

Start-Up Wizard - Three easy steps: Add Device, Set Credentials, Validate Backup, and you are ready to start configuration management

Change Advisor - Change Adviser can work with existing or draft configurations. Using the Change Adviser and comparing the configuration with the interface change to the prior configuration, the Change Adviser generates the list of commands necessary to roll back that change, leaving the password changes untouched.

Integration with NMS and other networking Tools - Easily correlate monitored activity with actual changes that have happened on the network. Works with NMS, password management apps, Scrutinizer, and many others

Disaster Recovery - Net LineDancer Configuration Recovery allows you to put configurations into replacement devices and restore them

SmartChange - templates for running unique commands against devices all at once, created with a point and click interface, supporting per-device value parameterization, and Excel spreadsheet import

Draft Configurations - Create configuration drafts from existing device configurations or import from text files. Draft configurations can be edited directly and pushed to the device (running or startup configuration). Drafts can be compared to existing configurations to verify that only the parts you expect to change are affected.
